Noritz America Corp. Presents the Future of Tankless: the Super Efficient Condensing Tankless Water Heater

Fountain Valley, CA –Noritz America Corp, the #1 manufacturer in tankless technology has just announced another addition to its 2008 tankless water heater line for residential applications. Global warming has become an alarming issue over the years and it poses a threat for our current and future generations. Noritz has realized the concern and has developed the future of tankless water heaters to help address this issue.

The new super efficient model, N-084MC, is the result of Noritz's tireless dedication to technology development. The new condensing technology yields 93% energy efficiency versus 60% of a typical tank water heater. This will dramatically decrease the production of carbon dioxide, which will help reduce the emission of green house gases and contribute to the reversal of global warming.

The new condensing unit is similar in its exterior design as other Noritz products, but is more technologically advanced in the inside. The main component of this new technology is the super heat exchanger. There are actually 2 heat exchangers fused into one. A primary heat exchanger is comprised of copper and secondary is stainless steel. This is the result of the synergy between Noritz's advanced technology and eco-friendly goal.

Noritz debuted this environmentally friendly heater at the 2007 Kitchen and Bath Industry Show in Las Vegas.
