Noritz Announces Concentric Vented Heater to Maximize Installation Options

FOUNTAIN VALLEY, Calif., - Noritz America, the leader of tankless technology, introduces the N-0751M-DVC, a new tankless water heater aimed at combining the advancements and power of the 751 Series with the convenience of concentric venting available mid 2008.

This new concentric vented heater enhances the capabilities of customers to deliver endless hot water in air constrained areas with simple, single penetration installation. This indoor unit provides up to 9.8 gallons of hot water per minute, ideal for homes with up to four showers. The concentric venting allows this heater to be installed in small spaces with limited air flow and requires zero venting clearance.

The N-0751M-DVC also utilizes a re-engineered heat exchanger which increases its thermal efficiency. The heater's next generation dual flame burner gives this unit stable combustion over a wider range of water flow. This means that the N-0751M-DVC is capable of boosting output at higher flow rates, while at the same time reducing the unit's minimum required flow rate.

Noritz debuted this environmentally friendly heater at the 2008 AHR Expo in New York on January 22nd at the Javits Convention Center. For additional information on the N-0751M-DVC contact the Noritz Marketing Department at (866) 766-7489 or visit www.noritz.com.

ABOUT NORITZ- Noritz America has been developing and manufacturing the finest gas operated water heating products in the world since 1951 and is the number one manufacturer in the world for tankless technology. Increased environmental awareness, with the conservation of energy and space worldwide, has encouraged Noritz to expand globally.
